LOCAL AGENT WORKSHOP

ForgeRadar

Explore software ideas, inspect evidence, review a proposal and choose whether to build it.

QUICK START

Open: http://127.0.0.1:4317

Run locally:

```
Windows PowerShell: ./start.ps1
```

Next: After the engine starts, visit http://127.0.0.1:4317

YOUR FIRST SESSION

01 Install Node.js 24+, Git, Ollama and a local model. On Windows run ./start.ps1 in PowerShell; wait for the engine status.

02 Use the dashboard composer to request discovery, describe an idea or request a bounded prototype.

03 Inspect the proposal and evidence. Treat scores as estimates; a limited search cannot prove demand or originality.

04 Choose an offline prototype or persistent Node + SQLite app. Build only after approving the proposal in the interface.

05 Review generated files and QA results yourself. Use GitHub Sync only when ready; it creates a separate private repository and sends an explicit source allowlist.

DATA AND PRIVACY

Local inference needs the worker and Ollama running. Hosted-dashboard instructions wait in the browser outbox until the worker laptop reconnects. It cannot run while that computer is off.

LIMITS TO KEEP IN MIND

Generated workflows are bounded and need owner review. Fixture tests do not prove a live-model mission. Check privacy and costs before enabling external discovery APIs.
